8th Grade Science Unit 3 Changing Earth STAR Cards!

QUESTION	ANSWER
3a) ★★★ 1. What are <u>convection currents</u>? 2. What causes <u>convection currents</u>?	3a) 1. <u>Convection currents</u> are big circles of moving gasses or liquids 2. <u>Convection currents</u> happen when hot gasses or liquids rise and cool gasses or liquids sink
3b) ★★★ What is the role of <u>convection currents</u> in the Earth's mantle?  The diagram shows a cross-section of the Earth. At the top, a layer of 'Plates' is shown with arrows indicating they are moving. Below the plates is the 'Mantle', and at the bottom is the 'core'. Two large circular arrows within the mantle are labeled 'Convection Currents', showing a clockwise flow. The arrows indicate that material rises on the right side and sinks on the left side of the mantle, which in turn causes the tectonic plates above to move in the same direction.	3b) <u>Convection currents</u> cause: ● hot magma to rise ● Then, it cools and sinks ● This makes Earth's tectonic plates move and creates mountains, earthquakes, etc.

QUESTION	ANSWER
3c)  Explain how the following processes change the landscape of the Earth: ● weathering ● erosion ● deposition	3c) ● <u>Weathering</u> breaks down rocks. ● <u>Erosion</u> moves pieces of rock away. <i>(see picture below)</i> ● <u>Deposition</u> is when rocks pile up. 
3d)  Fossil fuels and mineral ores are considered <u>non-renewable</u> resources. What does <u>non-renewable</u> mean?	3d) <u>Non-renewable</u> means it takes millions of years to form and it can run out when people use it.
3e)  Oil, coal and natural gas are fossil fuels.  How do fossil fuels form on Earth?	3e) Fossil fuels are formed when dead plants and animals are broken down, buried and squeezed by heat and pressure over millions of years.
