5 Science Unit 4 Food Chains

QUESTION	ANSWER
4a) ☆☆☆ 1. How do plants make their own food and grow? 2. What is this process called?	4a) 1. Plants use sunlight, air, and water to make sugar in their leaves. 2. This process is called photosynthesis.
4b) ☆☆☆ Describe how each of the 3 types of organisms get their energy 1. Producers 2. Consumers 3. Decomposers	4b) 1. <u>Producers</u> make their own energy through photosynthesis (ex. plants) 2. <u>Consumers</u> get their energy by eating other organisms. 3. <u>Decomposers</u> get their energy from breaking down dead plants and animals
4c) ☆☆☆ Finish this chart to show how matter moves through an ecosystem. 	4c) 

QUESTION	ANSWER
4d)  Where does energy begin in an ecosystem? <u>Explain why.</u>	4d) Energy begins with the Sun because the sun gives energy to producers to make their own food - (which starts the cycle of energy through an ecosystem)
4e)  What are two examples of how animals use the energy they get from food?	4e) Animals use energy from food to: ● Grow ● Move ● Stay warm ● Repair their bodies ● Reproduce (Have babies)
4f)  1. What is a composter? 2. What are the 4 major qualities of a good composter?	4f) 1. A composter is a device created by humans to help break down food scraps into soil. 2. A good composter: 1) Lets air in 2) Keeps the right amount of moisture 3) Is easy to open 4) Keeps pests (like mice) out
