

Name _____ HR _____

8th Grade Science Unit 2 Changing Climate STAR Cards!

QUESTION	ANSWER
2a) ☆☆☆ Why is it warmer in the summer than in the winter in Massachusetts?	2a) • Summer is when our hemisphere is tilted toward the sun ... • ...so there is more direct sunlight on our part of the Earth - which makes it hotter. 
2b) ☆☆☆ What is the difference between <u>weather</u> and <u>climate</u>?	2b) <u>Weather</u> is the temperature and precipitation on any given day. <u>Climate</u> is the average weather over a long period of time.
2c) ☆☆☆ Explain the 2 ways that the ocean's water influences the climate of places near the ocean.	2c) 1. Places near the ocean have warmer winters and cooler summers 2. Ocean currents bring warmer temperatures to places near the poles and cooler temperatures to places near the equator.

QUESTION	ANSWER
2d)  • What is it called when two air masses meet? • What happens when two air masses meet?	2d) • When two air masses meet, it's called a front • Warm air rises above cool air. This often creates stormy weather. 
2e)  How is the weather in a <u>high pressure</u> area different from the weather in a <u>low pressure</u> area? 	2e) <u>High-pressure</u> areas = clear skies and sunshine. <u>Low pressure</u> areas= rain and storms.
2f)  Most scientists think that climate change is the biggest threat to our environment. How does burning fossil fuels cause global warming and climate change?	2f) Burning fossil fuels releases carbon dioxide. This carbon dioxide forms a “blanket” in the atmosphere that traps heat from the sun. (preventing the heat from escaping back into space)
2g)  Name at <u>least 2</u> effects of global warming and climate change.	• Sea level rise • Extreme weather (ex. droughts, stronger storms, wildfires) • Mass extinctions
