QUESTION	ANSWER
1a) ☆☆☆ 1) What is the first step to <u>adding or subtracting decimals</u> and why do you need to do it? 2) Is this answer right or wrong? Explain why. $4.25 + .1 = 4.26$ 	1a) 1) The first step to <u>add or subtract decimals</u> is to line up the decimal points so you add or subtract the same place values together. 2) This answer is wrong because they added the 1 tenths to the 5 hundredths. The 1 tenths needs to be added to the 2 tenths. $\begin{array}{r} 4.25 \\ + .1 \\ \hline 4.35 \end{array}$
1b) ☆☆☆ $.32 \times 4.3 = 1376$ 1) Place the missing decimal point in the answer above. 2) When you are <u>multiplying decimals</u> how do you know where to place the decimal point?	1b) 1) 1.376 2) When <u>multiplying decimals</u>: - count the number of decimal places in your factors - use that number of decimal places in your answer. $.32 \times 4.3 = 1.376$ 
1c) ☆☆☆ What needs to be done before dividing these numbers? $.2 \overline{) 4.32}$	1c) Step 1) Make the divisor a whole number by moving the decimal one place to the right  $2 \overline{) 4.32} =$ Step 2) In the dividend, move the decimal point the same number of places. Step 3) Now pop the decimal up and divide $2 \overline{) 43.2}$

1d)

How do you find the Least Common Multiple (LCM) of two numbers?

Example:

Find the LCM of 4 and 5

1d)

To find the LCM, **skip count** with both numbers until they meet for the first time.

LCM = 20

1e)

How do you find the Greatest Common Factor (GCF) of two numbers?

Example: Find the **GCF** of 8 and 12

1e)

Step 1) Find all the **pairs of factors** for each number.

Step 2) Find the **biggest number** that is on both lists.

<u>Step 1</u>	<u>Step 2</u>
8: 1 × 8 2 × 4 12: 1 × 12 2 × 6 3 × 4	GCF = 4
