

Name _____ HR _____

2

5 Science Unit 2 Earth's Matter

QUESTION	ANSWER
2a) ☆☆☆ We can describe and compare different substances using their <u>properties</u>. List at least 3 properties we can use to describe and compare substances.	2a) ● Color ● Hardness (how easy it is to scratch) ● Shininess (reflectivity) ● If they attract magnets (magnetism) ● If they carry heat or electricity (conductivity) ● If they dissolve in water (solubility)
2b) ☆☆☆ What are the three states of matter on Earth and how do their particles behave?	2b) 1. <u>Solid</u>: particles are packed closely and only vibrate. 2. <u>Liquid</u>: particles move around more and are a little spread out. 3. <u>Gas</u>: particles move quickly and are very far apart 
2c) ☆☆☆ What is a phase change?	2c) A phase change is when matter changes from one state to another.

QUESTION	ANSWER
2d)  1. What happens when you add heat to a substance? 2. What happens when you take away heat from a substance?	2d) 1. Adding heat can make solids melt into liquids and liquids evaporate into gases. 2. Taking away heat can make gases condense into liquids and liquids freeze into solids.
2e)  What is special about gases compared to the other states of matter?	2e) Gas particles always take up the amount of space available. So they will expand as you blow up a balloon or they will come close together when you compress them in a small space.
2f)  What happens to the mass of matter when it changes form or mixes with something else?	2f) The mass stays the same as long as it's in a closed system (like a container with a lid). Matter can change form, but it doesn't disappear.
2g)  What is the difference between a mixture and chemical reaction?	2g) A mixture is when you combine two or more substances and you can separate them back. (Ex. If you mix sand and water together you can separate them again) A chemical reaction is when you combine two or more substances and it makes a new substance that you can't separate easily. (Ex. If you mix baking soda and vinegar it bubbles up and you can't separate the baking soda out).
